

VAL: Virtual ASSISTments Laboratory

Joseph E. Beck and Neil T. Heffernan

ASSISTments + web pages = WEBsistments

- ASSISTments: web-based ITS
 - Tens of thousands of student users
 - Primarily used for math education, but is independent with respect to curriculum
- Have augmented it with web pages to teach students

Automatically evaluate pages

ASSISTments + web pages = WEBsistments

- ASSISTments: web-based ITS
 - Tens of thousands of student users
 - Primarily used for math education, but is independent with respect to curriculum
- Have augmented it with web pages to teach students
 - **Which web pages?**

How we select web pages

- Have been searching the web to find good ones
 - We don't want to be in the content creation business
- Why not create web pages?
 - Too expensive, most ITS designers lack the knowledge

Ok, who said ITS designers were creating the pages?

- There are other content creators out there
- E.g., cognitive and educational psychologists
 - They often have ideas they want to test

Problems with running RCTs (Randomized Controlled Trial)

- Need to acquire subjects

Need to acquire subjects

- Want representative sample of your population
 - Much psych research done with undergraduates
 - Should be a diverse population
- Want to get several subjects
 - Costs money, or competing with others for subject pool (can get nasty)

Problems with running RCTs

- Need to acquire subjects
- Authenticity of learning task

Authenticity of the learning task

- Many lab studies on learning use a synthetic task
 - Goal is to control for subject's prior knowledge
- So they work on a meaningless task that has no relevance to anything later
 - Anyone see a problem?

Problems with running RCTs

- Need to acquire subjects
- Authenticity of learning task
- Longitudinal is hard

Longitudinal is hard

- Expensive to bring subjects back in later
 - More than just twice as hard, you'll lose subjects so need to overrecruit
 - Also more variability in subjects over time → more subjects needed
- Need to keep contact info for subjects
- Reserve lab facilities again
 - Easier to run 2 studies

Problems with running RCTs

- Need to acquire subjects
- Authenticity of learning task
- Longitudinal is hard
- Collating the data

Collating the data

- Subject pre-test / questionnaire
- Performance during experimental condition
- Post test / questionnaire
- Have to create one file for analysis

That's a lot of problems!

- Need to acquire subjects
- Authenticity of learning task
- Longitudinal is hard
- Collating the data

Can ITS make this easier?

- Need to acquire subjects
- Authenticity of learning task
- Longitudinal is hard
- Collating the data

You want subjects? (>20k students now)

Authentic learning task

ASSISTments

You are previewing content. Problem 30 - 2002 (#4517)

The Venn diagram below shows Leila's graduating classes from middle school, high school, and college. How many students graduated together from **both** Leila's middle school and high school?

Leila's Graduating Classes

Region	Number of Students
College only	393
High School only	469
Middle School only	12
College and High School	1
College and Middle School	2
High School and Middle School	126
All three (College, High School, Middle School)	4

Done

Longitudinal is easy

- Ming Feng predicted student test scores on a state test
 - Two years after students finished with ASSISTments
- We store information in our database by student

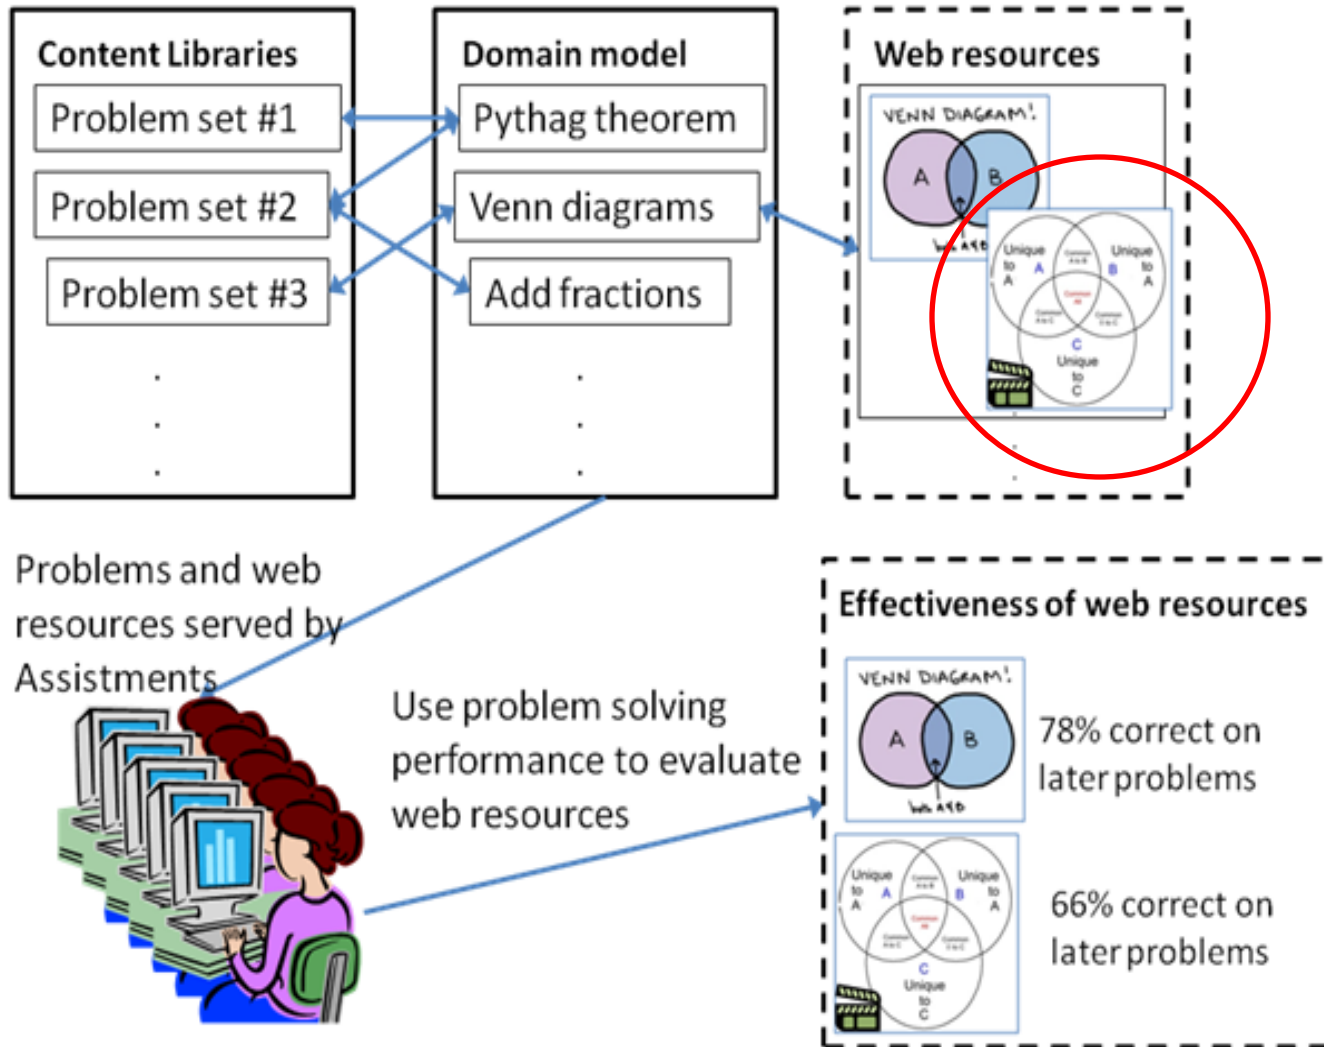

Collating the data

- That's why we have databases :-)
- Everything logged, relatively straightforward to assemble

Summary

- Running good RCTs on human learning is hard
- ITS have several aspects they can simplify
- Big question: how do researchers get their experiment into ASSISTments?
– ???

Can evaluate an *arbitrary* web page

The model

- Researcher has idea for how to teach
- Instantiates experiment as two competing web pages
- Add pages to WEBments
- Collect data on their performance

Simplifies experimental cycle

Step in experimental process	Manual	Semi-automated	Automated
Generate research idea	•		
Acquire subjects		•	
Intervention		• (design)	• (administer)
Record & collate data			•
Export data to tab-delimited file			•
Analyze and write up results	•		

A useful contribution

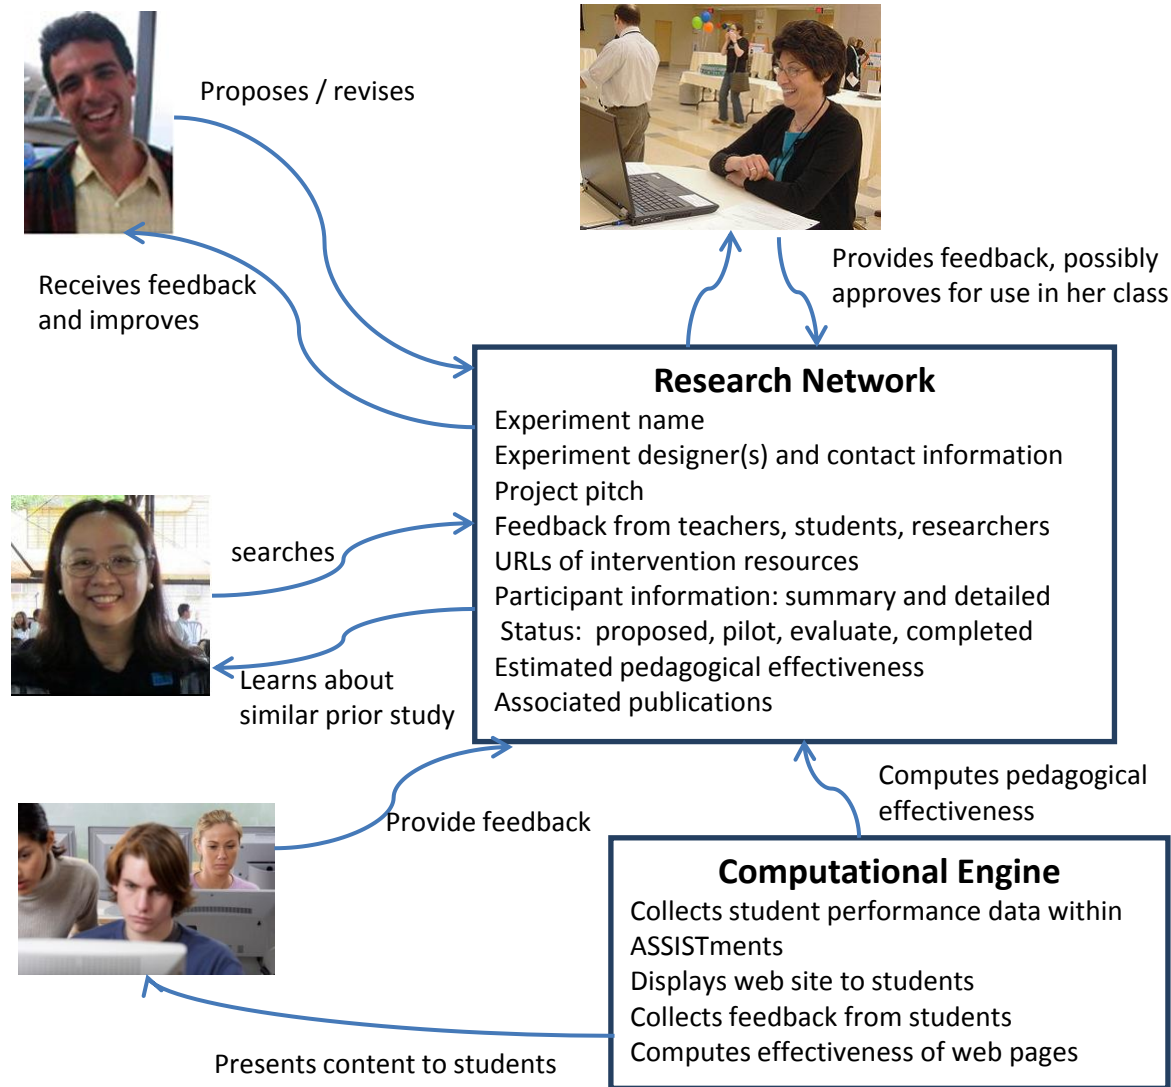

- Makes experimenter's life easier
- Possibly gets better content into our systems
- Connects us with domain researchers
- A win-win!

Concerns?

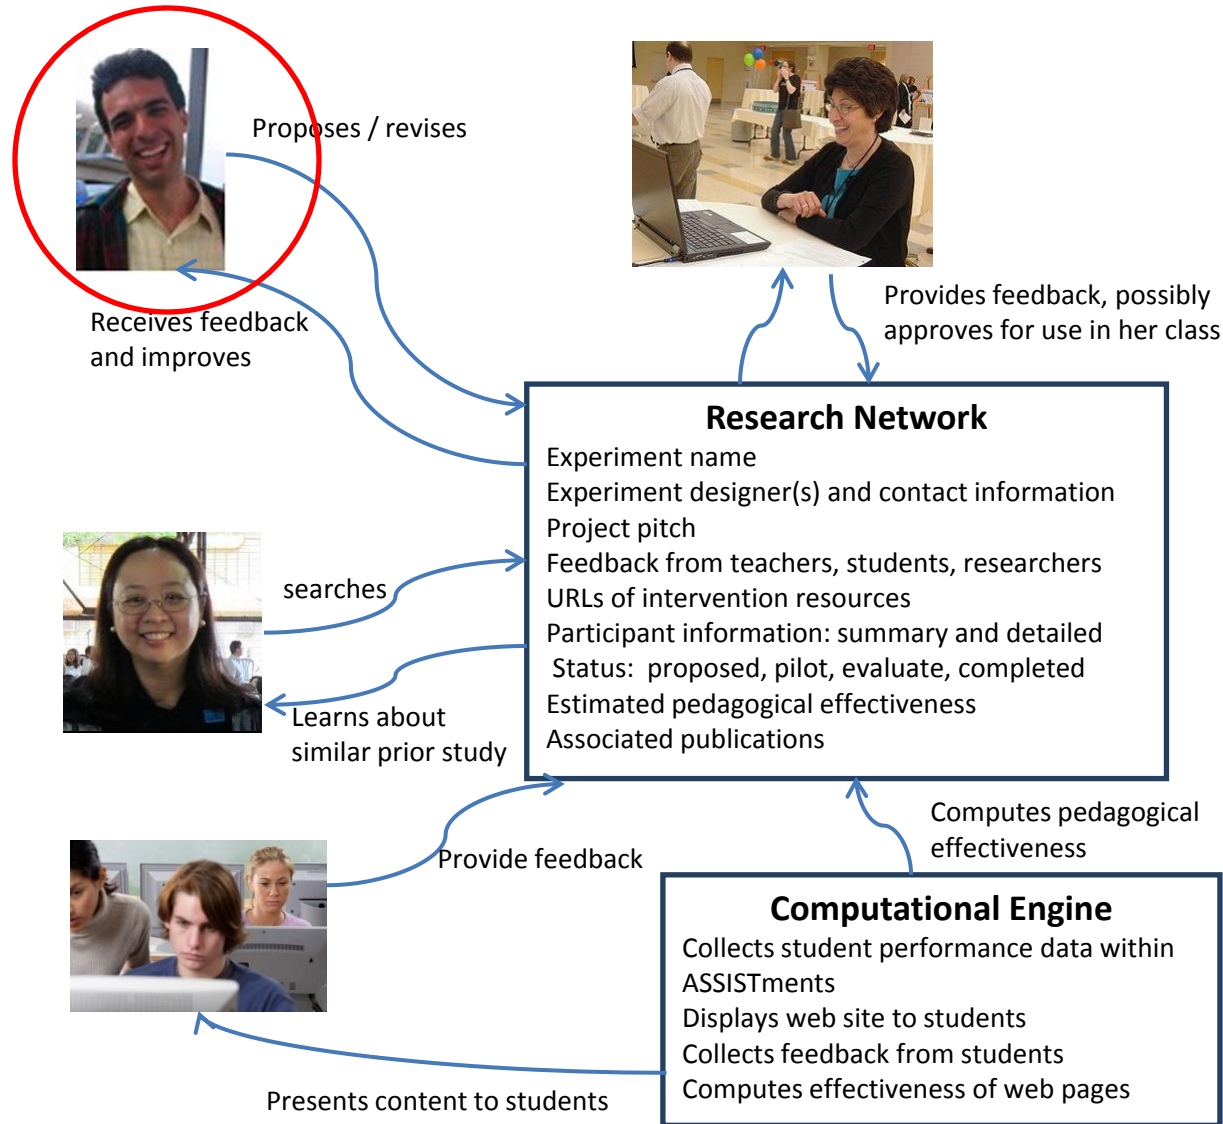

Concerns

- What if experiments are badly conceived?
- Do teachers get control over what happens in the classroom?
- At WPI we have some trust (and they're using our system)
 - Does not necessarily transfer to others
 - We don't want to burn our goodwill

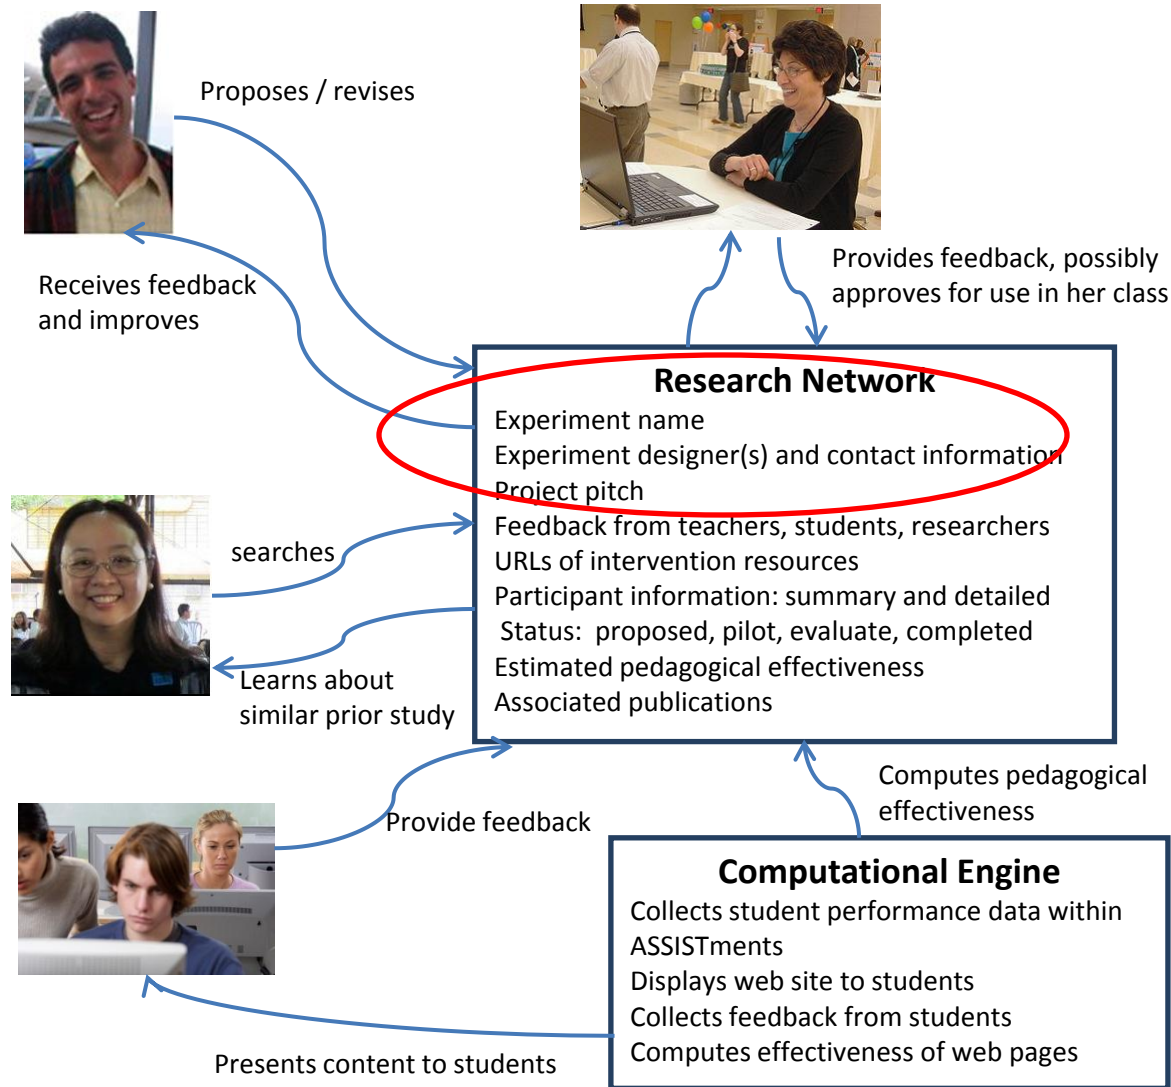

Thinking of a much bigger process

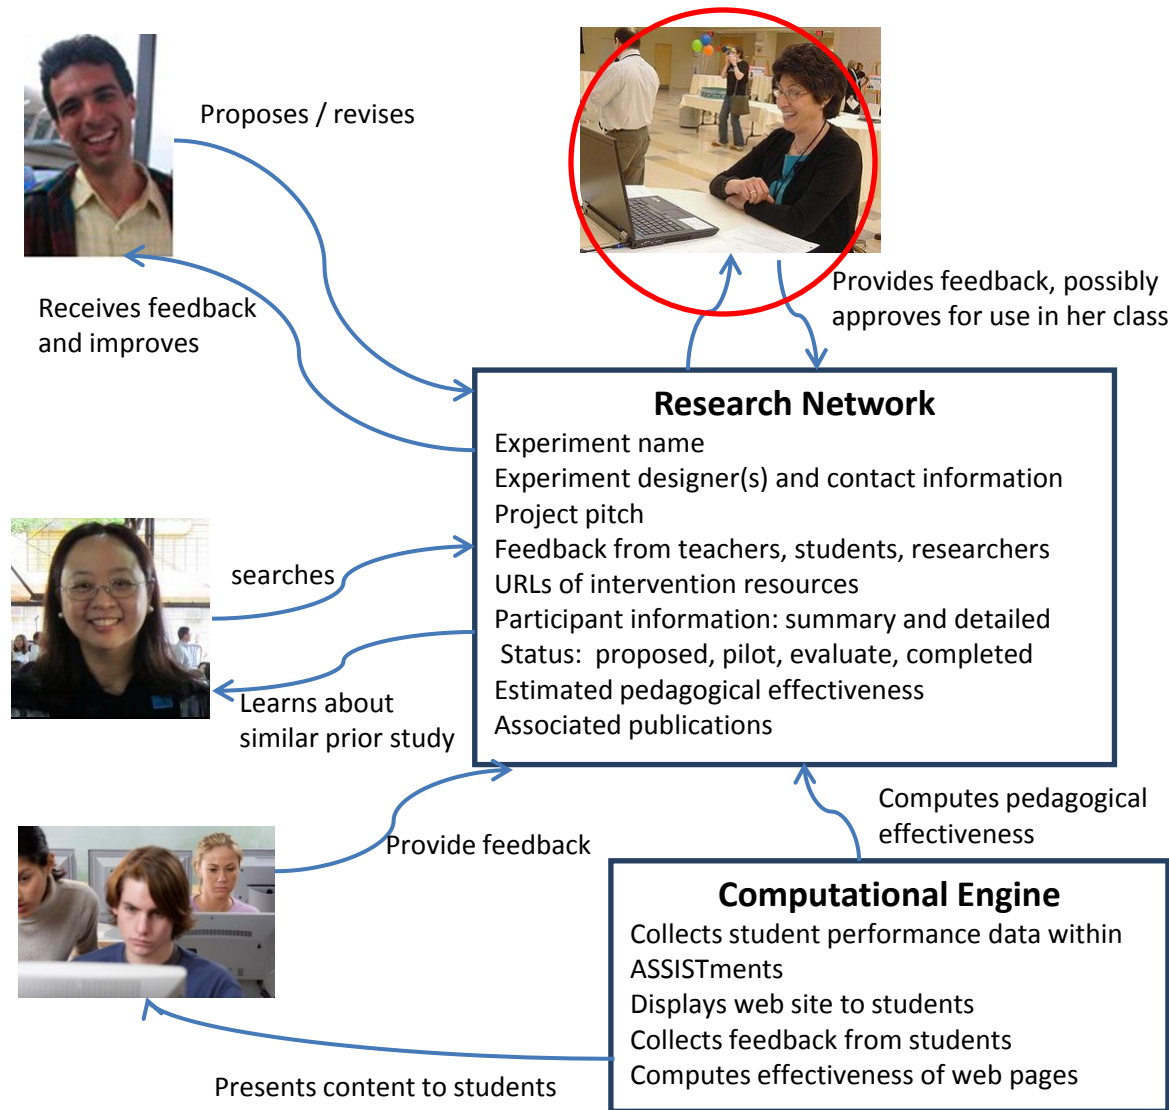

Ido gets an idea...

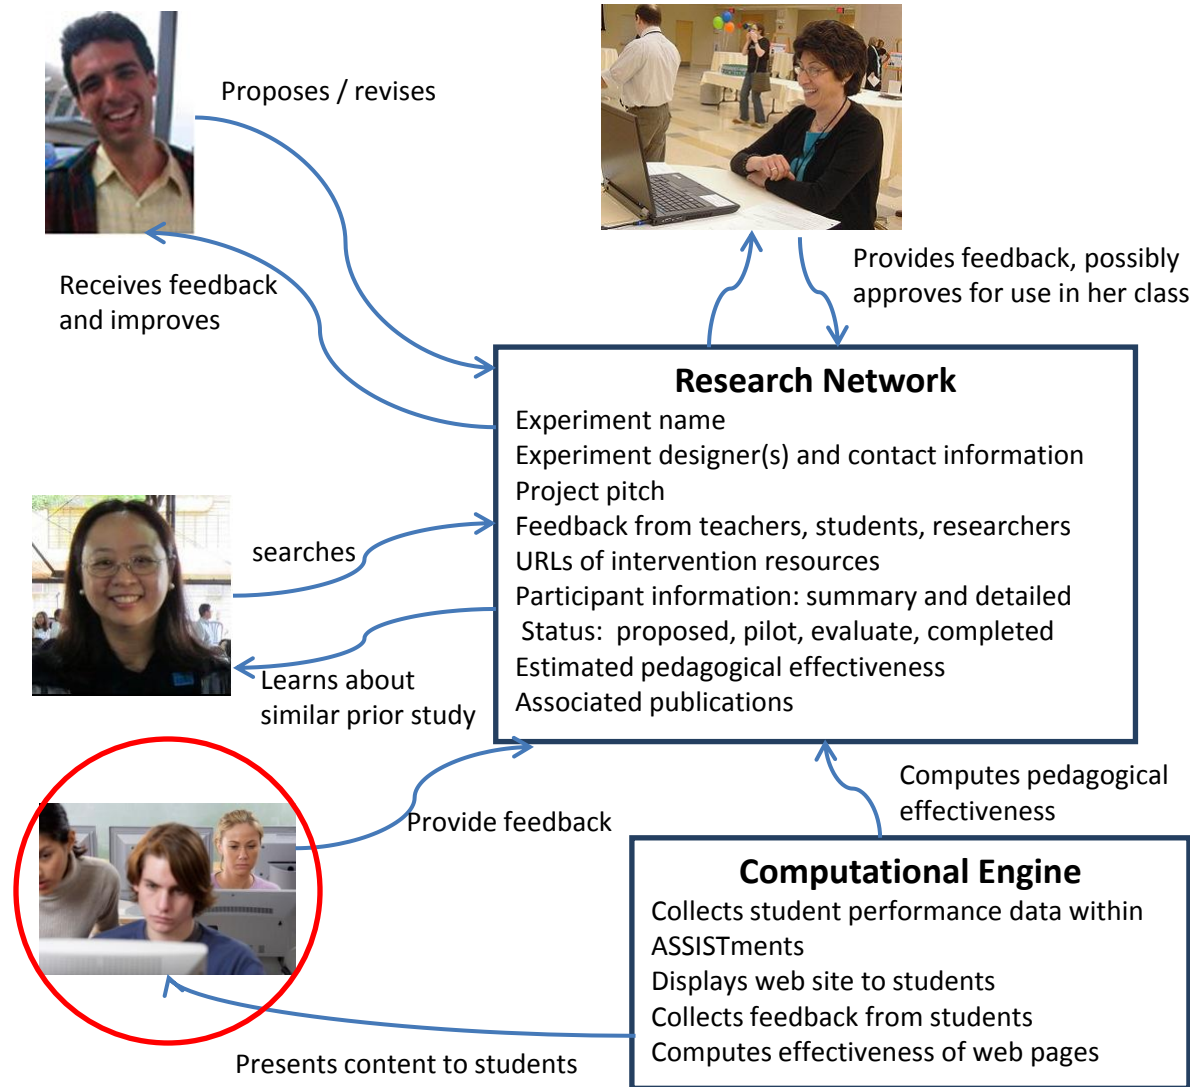

Ido creates project pitch (text, video...)

Gets feedback from teacher

If approved gets feedback from students

Comments are useful

ASSISTments

You are previewing content. Problem 30 - 2002 (#4517)

The Venn diagram below shows Leila's graduating classes from middle school, high school, and college. How many students graduated together from **both** Leila's middle school and high school?

Leila's Graduating Classes

A Venn diagram with three overlapping circles labeled College, High School, and Middle School. The numbers in the regions are: College only: 393; High School only: 469; Middle School only: 12; College and High School: 1; College and Middle School: 2; High School and Middle School: 126; All three: 4.

Region	Number of Students
College only	393
High School only	469
Middle School only	12
College and High School	1
College and Middle School	2
High School and Middle School	126
All three	4

Done

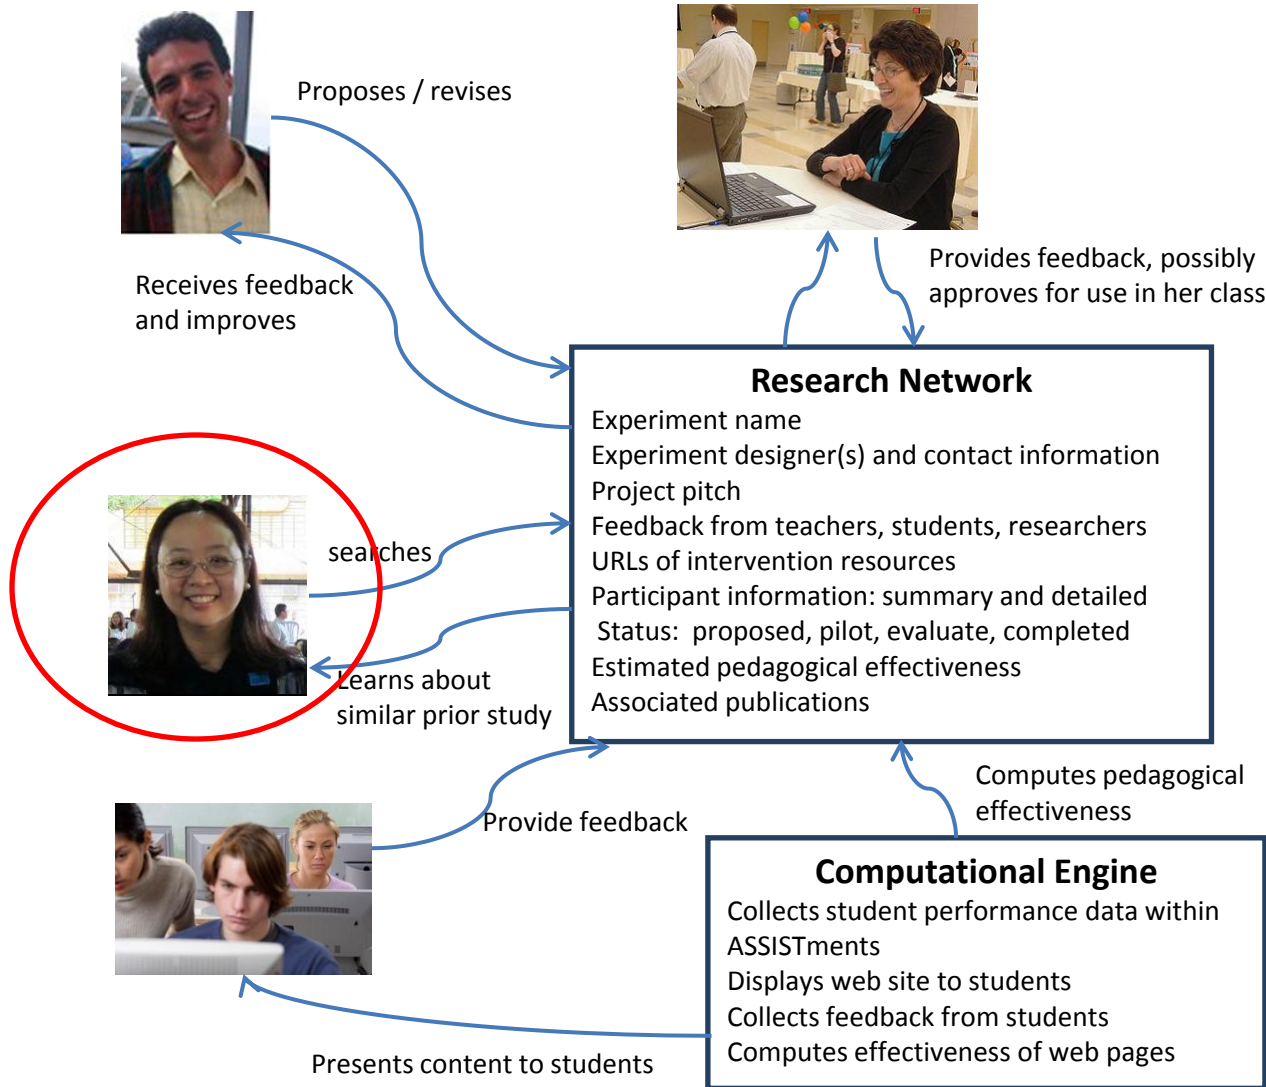

Gets automated analysis of experiment

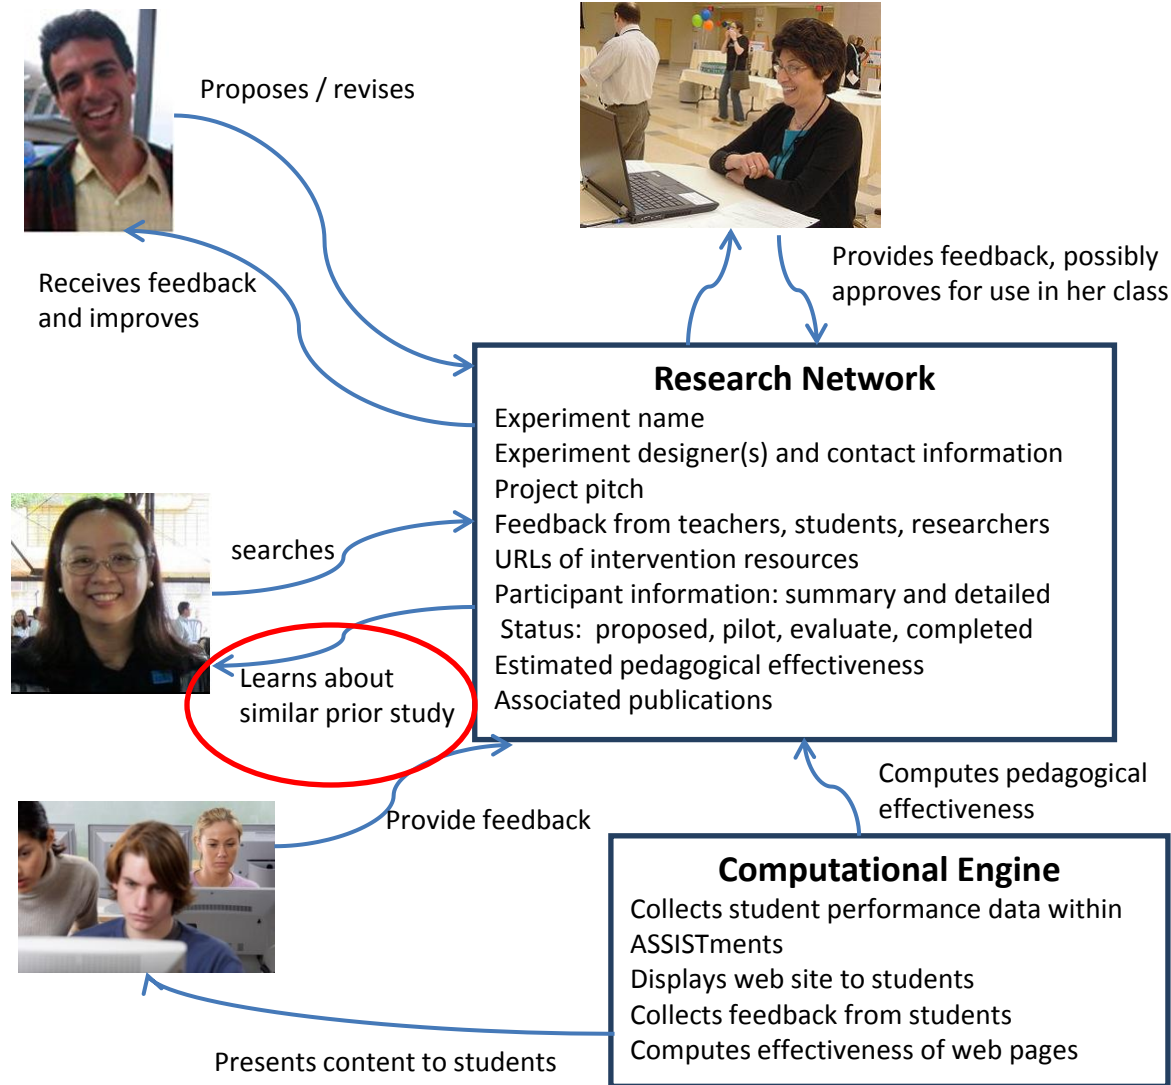

After experiment finishes, adds data to his experiment's entry

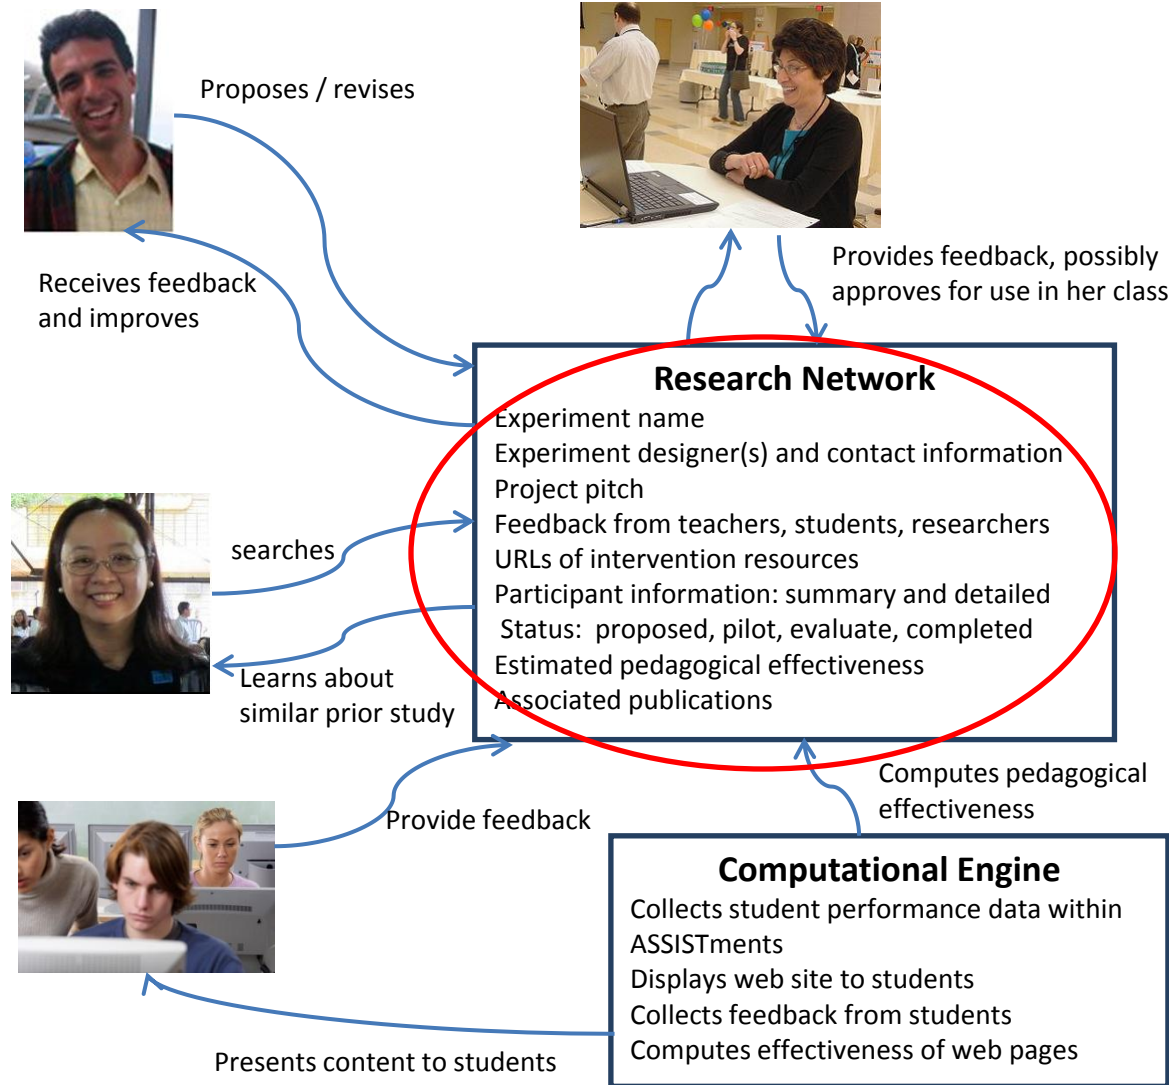

Didith comes along and checks if anyone has a similar idea

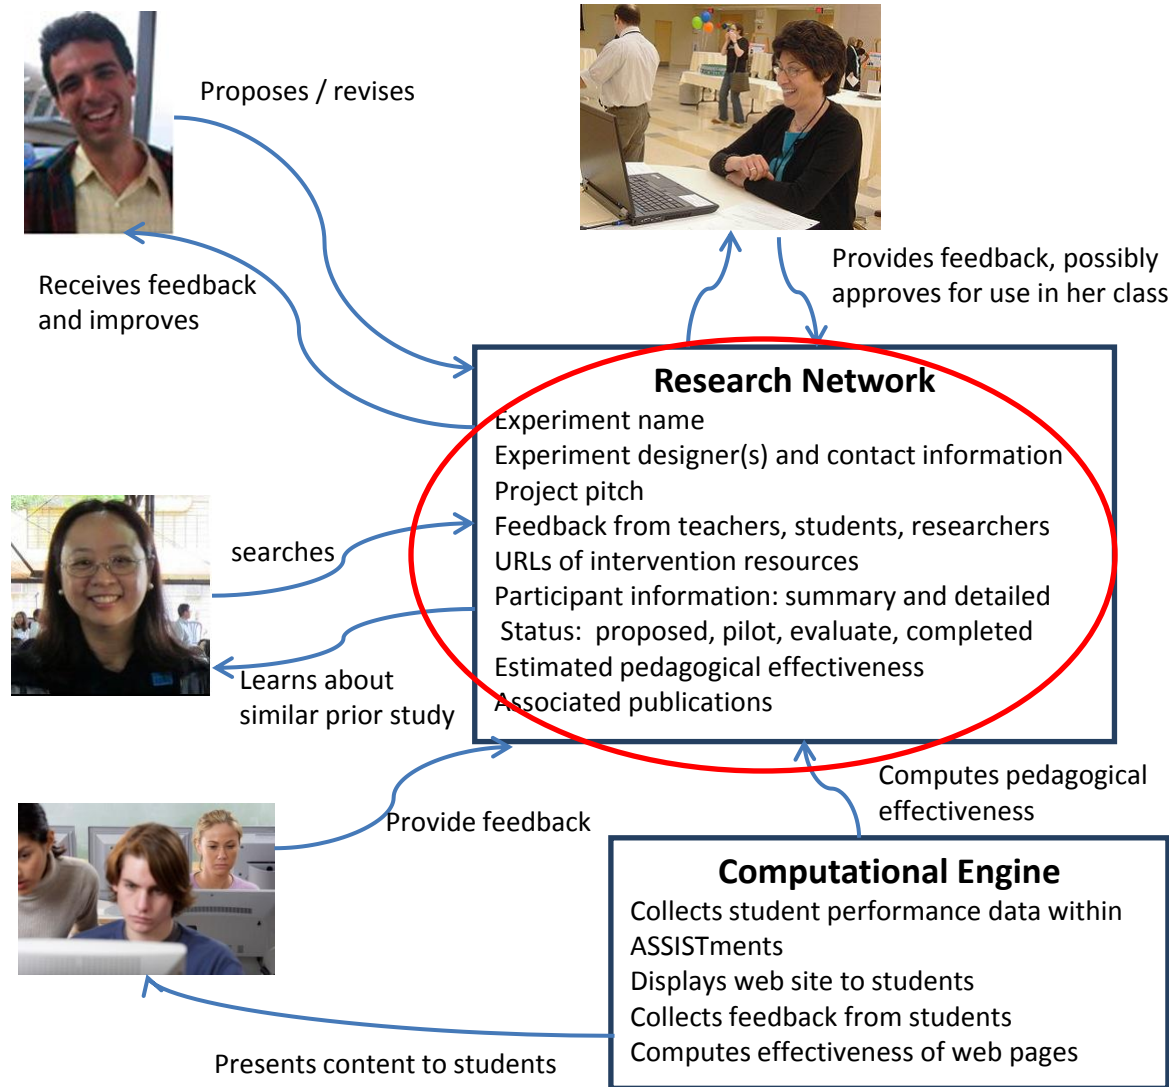

Can see outcomes of prior study

Much better than a paper abstract

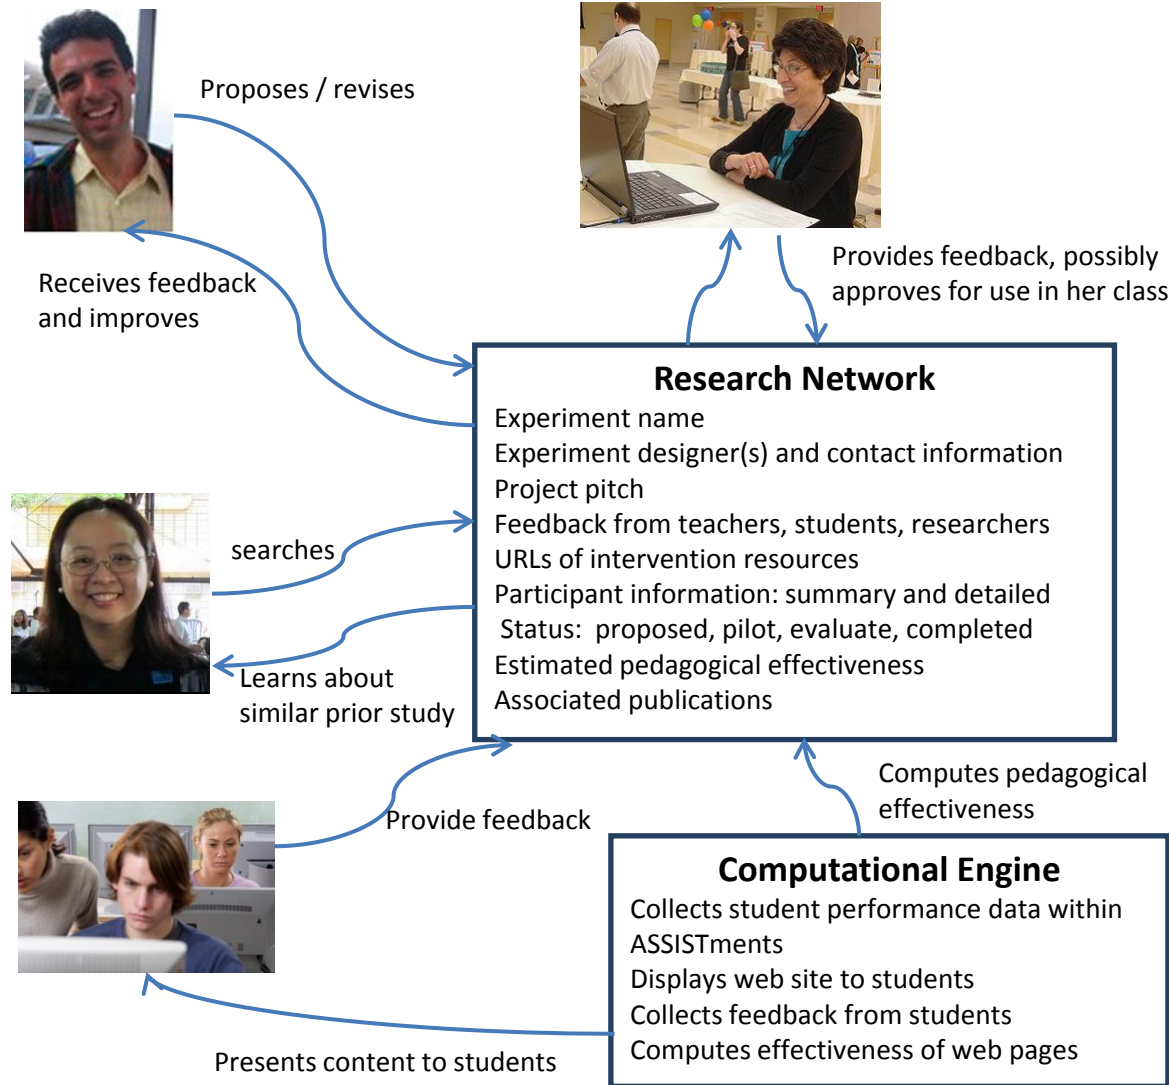

Has all the data you will need to *replicate*

Replication

- Essential for science to happen
- Ionnidis: medical researcher
 - Estimated 50% of medical research reached the wrong conclusion
 - Tested on the very best work, and found overturn rate was 40%
- Why EDM has replication as a listed goal

An interesting ecosystem

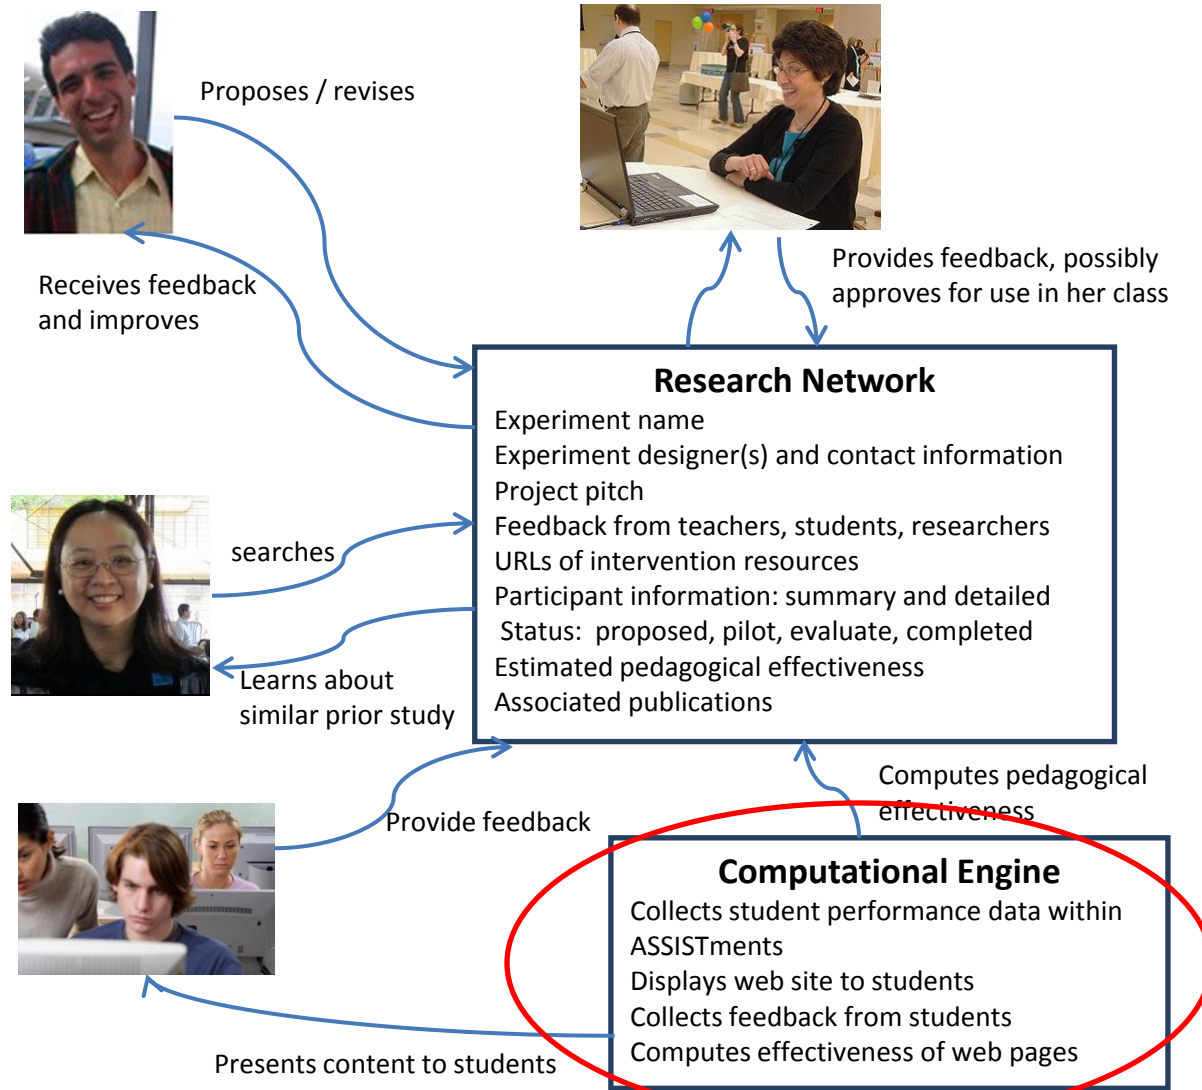

Easier to generate ideas

Step in experimental process	Manual	Semi-automated	Automated
Generate research idea		●	
Acquire subjects		●	
Intervention		● (design)	● (administer)
Record & collate data			●
Export data to tab-delimited file			●
Analyze and write up results	●		

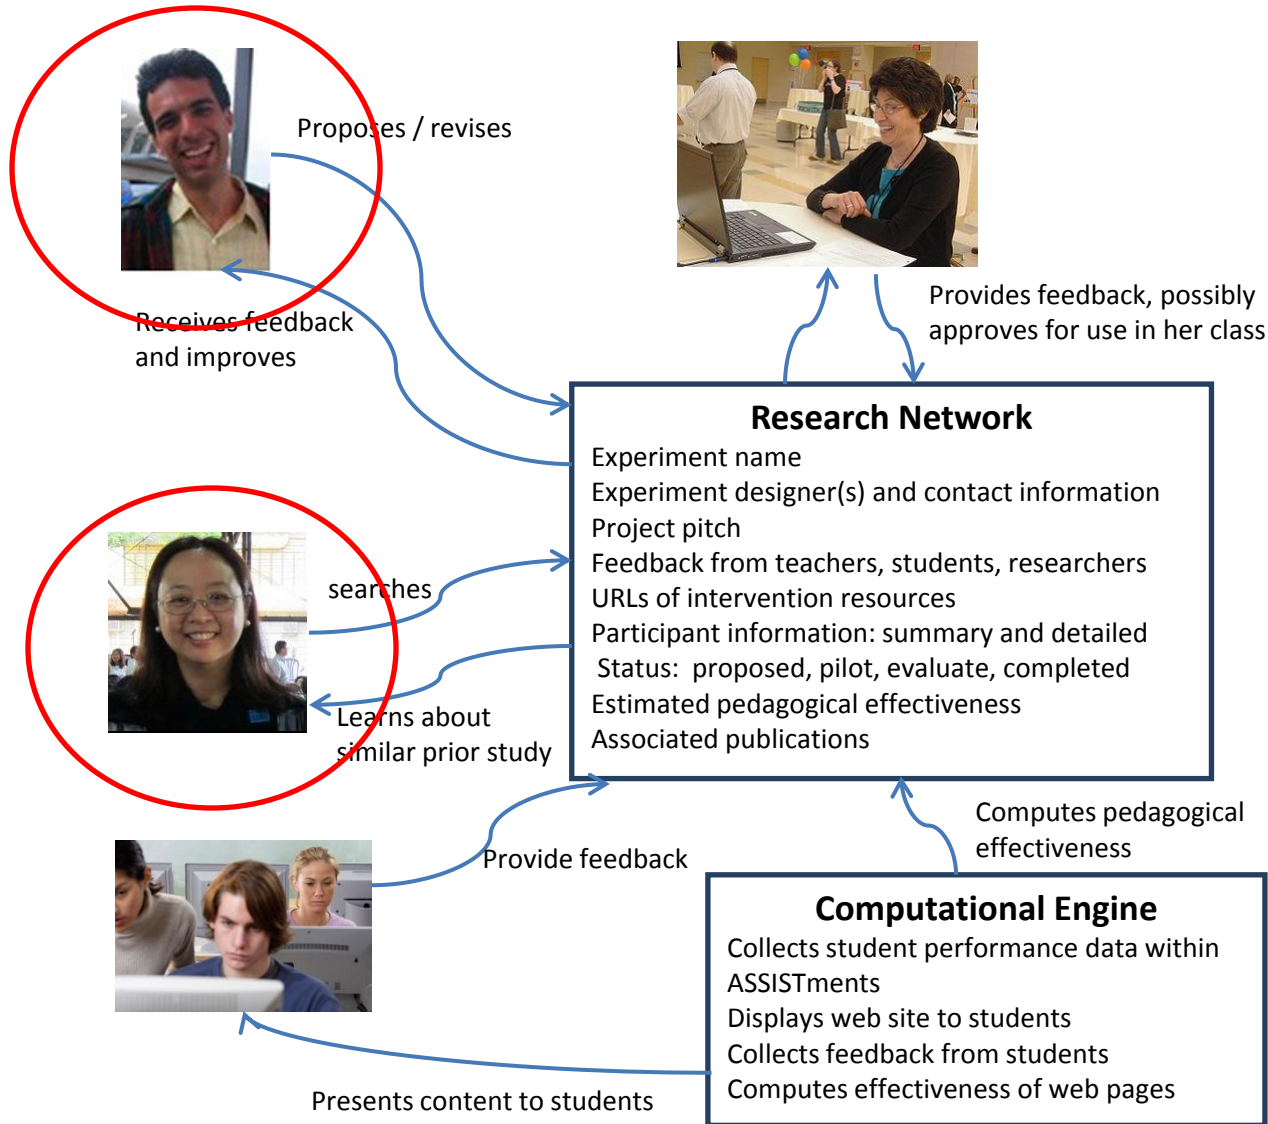

Future work

- Almost all of it :-)

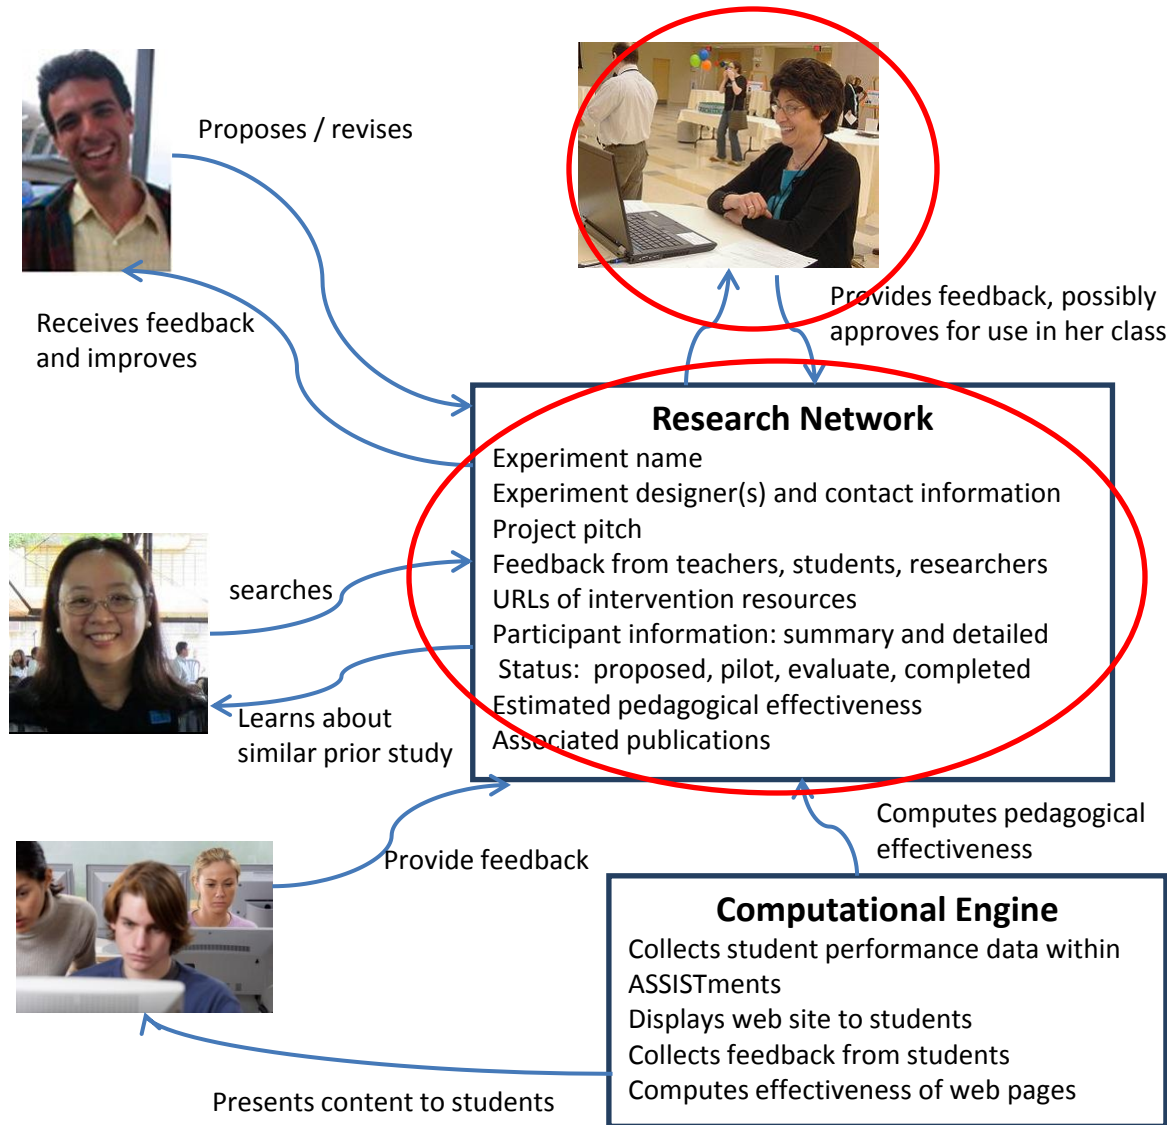

Computational Engine mostly exists

Ido and Didith exist

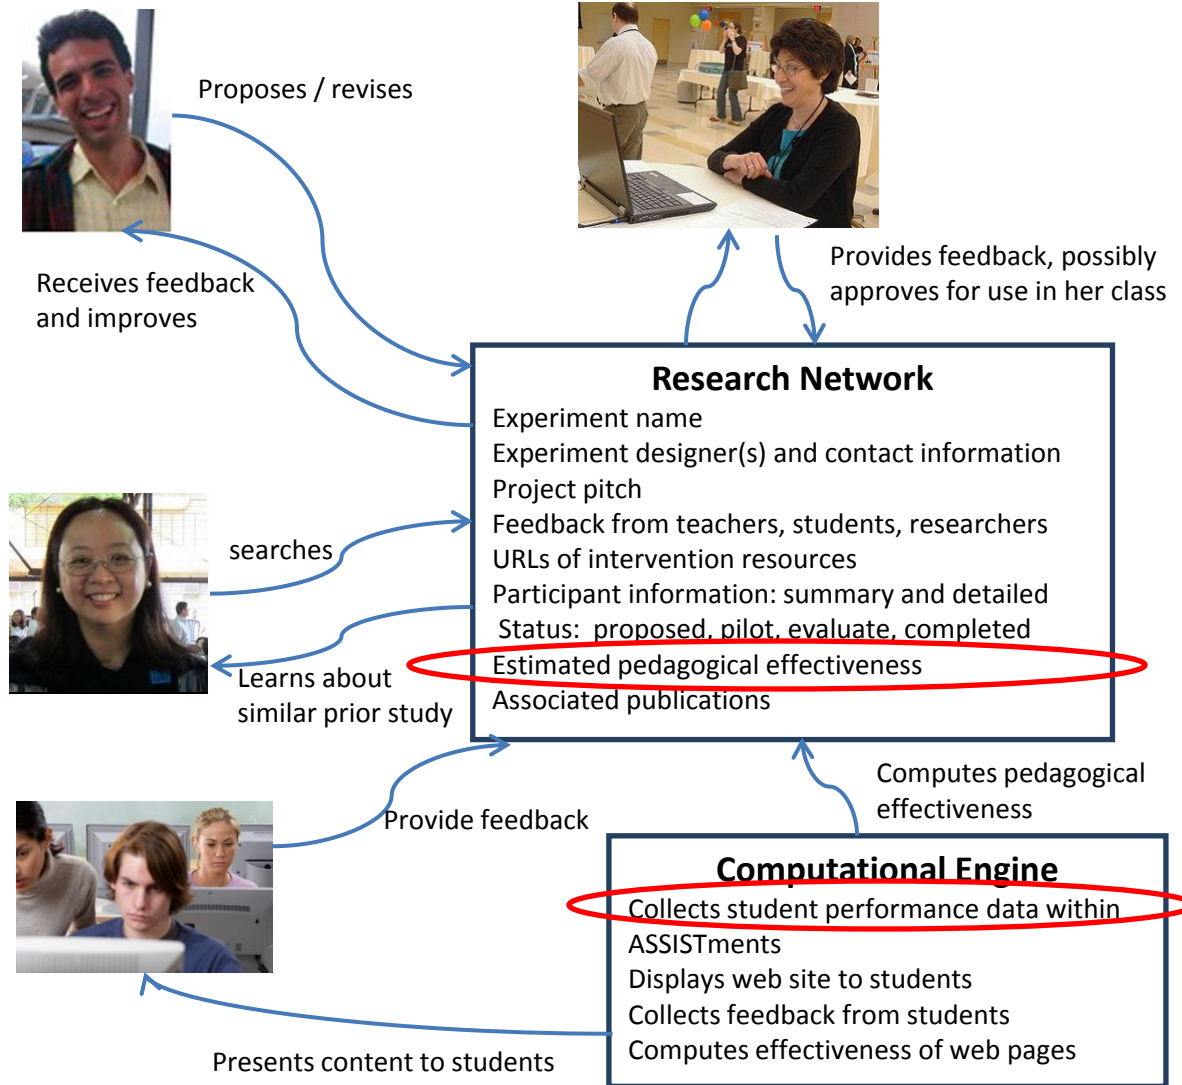

Need to create network and get teachers more involved

Why I think this work is neat

- Makes ITS much more useful
 - Experimental platform might be best use (Chuck Perfetti, over a decade ago)
- Addresses authoring tool problem
 - Lots of tools proposed and built, none took off
 - Authors use whatever tool they want to create a web page
- Some meaty EDM challenges

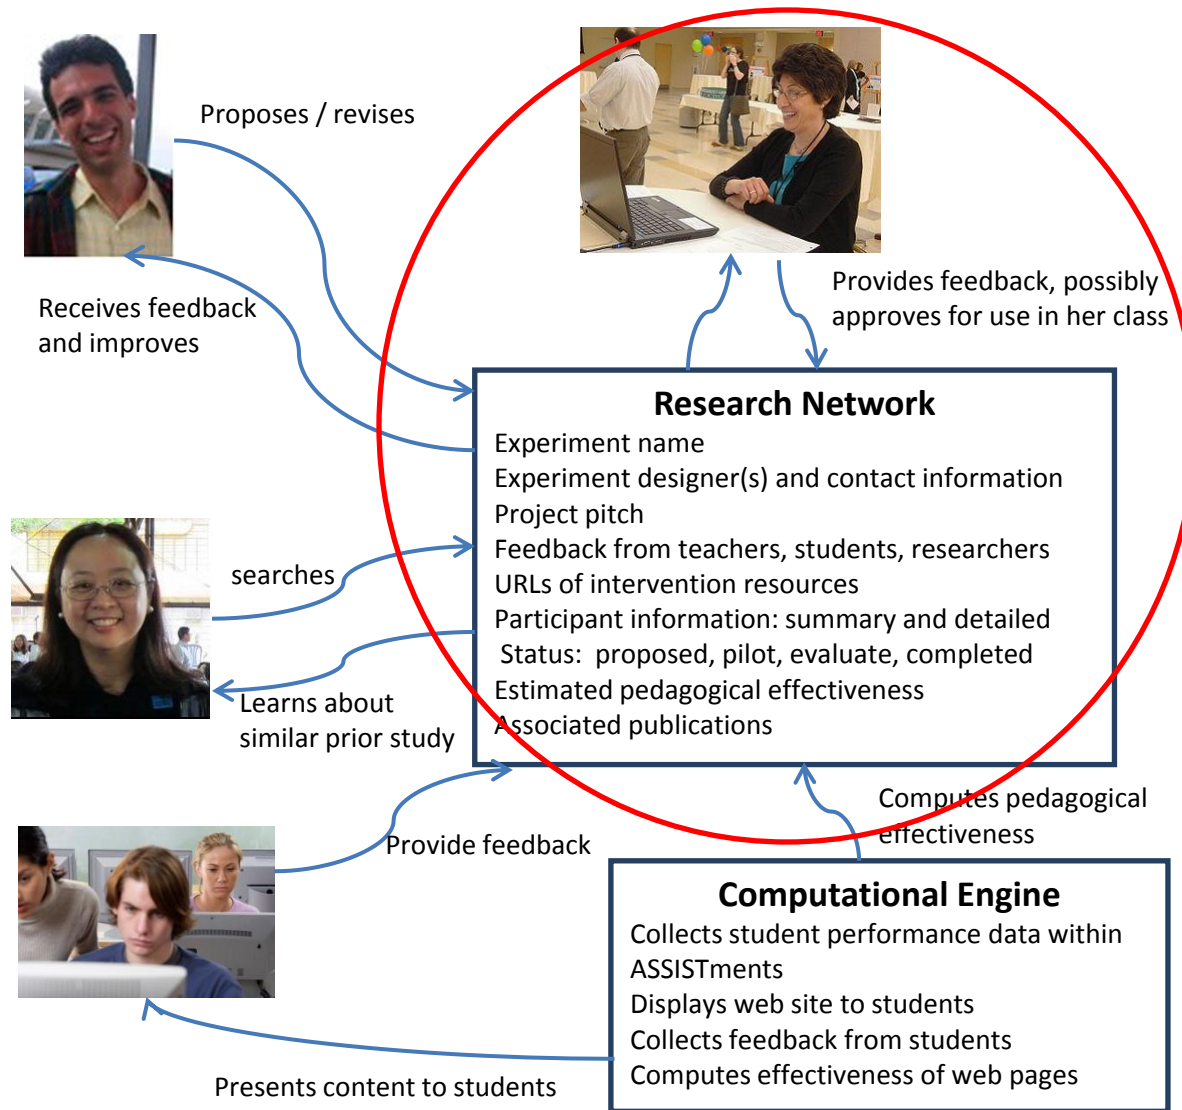

Tough EDM challenges

Neat EDM work

- Automatically evaluate an arbitrary intervention
 - Do we know enough to automatically create outcome variables
- Automatically output features for researchers
 - Which ones are important

Also social computing work

Conclusions

- We're trying to make this happen
 - Trying to acquire funding
- In the meantime, working on evaluating known web pages (WEBSistments → EdRank)
- One of our current “big ideas”
 - WEBSistments, EdRank, VAL
