Knowing Consumers Better

- Graphic and fashion designer
  - more effective and time-saving to reach potential consumers
    - by understanding their viewing patterns
    - to design more attractive products
    - by stimulating consumer's desire.

Other Applications：Eye Tracking on Flying Fighter

Cooperative Research

We hope to cooperate with you for co-study, project proposal, design, experiment, analyze, and publish on SSCI

For your research interests, topics.

We provide:

- EyeNTNU experiment to your closest location.
- Experimental design discussions
- Experimental assistance (write software or apps for interested materials and staff training on devices)
- Data analysis (write software or apps if requested)
- Our team will rank next to you as a second author

New Opportunity ? Competitiveness ?

- Now we have eye trackers.
- We can assist in eye tracking experiments.
- Most researchers own one eye tracker, we have many sets.
- Analyze eye tracking data can be tough, we can assist.
- For your acknowledge field, new opportunities arise once added in eye tracking variables
- Used to do survey research, now we can use eye tracking instead.

Strategic Thinking, Idea

- Named any human eyes can see, EyeNTNU can try
  - E.g. Engineering, commerce, medicine
- Find ideas of existing SSCI papers, which did not use eye movement data
- Multiplayer eye tracking analysis

Brief on Published Research

- Not a detail report, but a rough one

- Please turn around for some children protected pictures

Memory span and contextual effects on lexical ambiguity resolution during Chinese sentence reading: evidence from eye movements

Graduate: Chih-yu Yang, Direct professor: Dr. Hwa-wei Ko

Graduate Institute of Learning and Instruction, National Central University

(2010, Master Thesis)

Abstract Given the fact that lexical ability and background knowledge play crucial roles in second language reading and yet less information is available for on-line reading processes, much empirical research is needed. In Study 1, 60 students of National Central University were tested in a read-aloud task. The results suggested that indices of both speed and accuracy significantly correlated with lexical ability, and accuracy could best represent for lexical ability. In Study 2, subjects' eye movements were monitored as they read scientific texts. The results indicated that lexical ability influenced the on-line reading processes, but background knowledge did not. Readers with higher lexical ability read faster, their forward and backward fixation duration was faster, and the regression rate was smaller. In addition, when subjects read twice, they had much reduced reading time, less fixations and longer forward saccade length in the second round. There was reading benefit. Overall, the eye movements of EFL college readers were quantitatively different from those of English native college readers.

Key words: polysemy, lexical ambiguity resolution, working memory, eye movements

Reading Ambiguity Result

Analysis of EFL college students' eye movements

Postgrad student：Hsiao-Ting Tseng, Direct professor: Dr. Hwa-Wei Ko
Graduate Institute of Learning and Instruction, National Central University
(2006,Master Thesis)

Abstract This study examined the effects of using context to solve the lexical ambiguity in reading sentences by recording participants' eye movement. Variables such as the frequency (dominate and subordinate), the degree of meaning relatedness (high and low) of the ambiguous word, the location of disambiguating context (preceding and following context) and the participants' memory span were included in the study. Chinese Reading Span Test developed by Hue (1996) was administered to distinguish the memory span of participants. The purpose is to investigate how memory span influences reader's reading while they process the ambiguous word in a context supported sentence. This study focused on the influence of the location of disambiguating context in ambiguous sentences reading. If an ambiguous word is at the second part of the sentence (context-before condition), the preceding context serves as a prime to activate the meaning of the word. If an ambiguous word is at the first part of a sentence (context-after condition), multiple meanings of the word will be activated at different levels depending on the frequency and the degree of meaning relatedness of the ambiguous word. It was hypothesized that readers with low working memory span would suffer in the context-after condition. The results of the study provided experimental support for the location of disambiguating context, the frequency and degree of meaning relatedness of ambiguous words affected the reading processing of ambiguous sentences, and also revealed the different process depending on the individual's working memory capacity. The location of disambiguating context plays an important role in ambiguous sentences reading. In the context-before condition, all participants were not affected by the frequency and degree of meaning relatedness of ambiguous words. However, in the context-after condition, low working memory span readers were more affected by the frequency and degree of meaning relatedness when compared to high span readers, they fixated longer on disambiguating region. Based on these results, researcher suggested text writing to take advantage of the contextual location clues to help reading, especially for low memory span readers.

Applying the eye-tracking approach to the study of information attention and decision bias

Postgrad student：Chiung-Wen Hsu, Direct professor: Dr. Feng-Yang Kuo
Department of Information Management, National Sun Yat-sen University

(2007,Doctor Thesis)

Abstract Based on the Prospect Theory by Kahneman and Tversky (1979) and the Impression Formation Theory by Fiske and Neuberg (1990), this research examines decision makers' information attention for subjects who are required to judge under framing. The eye-tracking technology is applied to evaluate decision makers' information attention. The results indicate that, as predicted by the Prospect Theory, the effect of framing is observed in both positive and negative framed conditions. Overall, the study finds that subjects in negative frames exert more effort in information attention than those in positive frames. Concerning the effect of the need for cognition (NC) trait in negative framing conditions, the finding shows that subjects who have a higher level of NC exert more effort in information attention than the low NC subjects. In addition, subjects with high a higher level of math ability focus exert more attentional effort on possible outcomes and probabilities in positive framing but not in negative framing. Finally, the result shows that there is no relationship between information attention and the framing effect, indicating that the framing effect is resilient to the influence of information attention effort induced by both the personality traits like NC and the mechanism like deep thought. Collectively, these results pave the way for future research to study cognitive processes under framing so that we can understand how different information representations may increase or lessen the effect of framing.

The relationship between connectives and reading processes: evidence from eye movements

Postgrad student：Yi-Ling Chan, Direct professor: Dr. Hwawei Ko
Graduate Institute of Learning and Instruction, National Central University
(2005, Master Thesis)

Abstract Three experiments examined the processes of connectives in sentence and text reading. The arguments about the processes of connectives are between delayed-integration hypothesis and incremental interpretation. According to delayed-integration hypothesis, readers process two clauses linked by a connective by interpreting each clause separately and combining them when they reach the end of the second clause. However, incremental interpretation considers semantic processing takes place incrementally. In the first experiment, adversative and causal connectives were found to be the most crucial in reading on the basis of a 5-1 scale rating. Afterward, readers' eye movements were monitored as they read sentences containing adversative connectives with different clausal semantic relatedness. The results showed readers spent more processing time on clauses with less semantic relatedness. Connectives could integrate clausal semantic information easily. There was no interaction between clausal semantic relatedness and connectives. Readers' first gaze duration on the end of second clause was not longer than any other content words. It seemed to indicate readers didn't integrate clauses at the end of the second clause. Readers integrated clause incrementally. In the third experiment, both adversative and causal connectives were inserted in text reading. The incremental interpretation was also observed These experiments support that connectives facilitate reading and readers integrate semantic units incrementally.

Abstract

Users' eyes can be a meaningful source of information for e-learning systems. What we look at, and the way we do that, can in fact be exploited to improve the learning process, disclosing information which would otherwise remain concealed. In this paper we describe an e-learning environment where eye tracking is used to observe user behavior, in order to adapt content presentation in real-time. To achieve such purpose, we consider both the way learning activities are carried out and those eye signals that can be related to the user's "emotional states".
